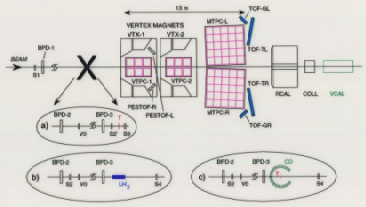
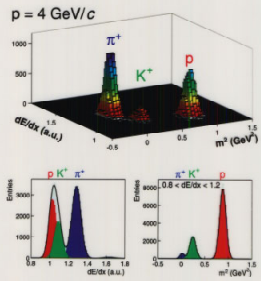
- MODELS
- SUMMARY

NA49 experiment



Large acceptance hadron detector

CENTRAL PB+PB AT 40 AGEV



σ(dE/dx) ≈ 4% , σ(TOF) ≈ 60 ps

NA49

LARGE ACCEPANCE HADRON DETECTOR AT SPS

CURRENT PHYSICS PROGRAMS:

- SEARCH FOR THE ONSET OF DECONFINEMENT BY STUDY OF ENERGY DEPENDENCE (20 – 160 A·GEV)
- UNDERSTANDING SYSTEM SIZE/CENTRALITY DEPENDENCE (p+p, p+A, C+C, Si+Si, Pb+Pb)
- STUDY OF LOW CROSS SECTION OBSERVABLES (D-MESONS, $\varphi \to e^+e^-$...) (Pb+Pb at 160 A·GEV)

LOW ENERGY PROGRAM AT SPS:

- TRIGGERD BY OBSERVATION OF ANOMALIES IN PION AND $s\bar{s}$ YIELDS LOCATED BETWEEN TOP AGS AND TOP SPS ENERGIES,

  M.G., D. RÖHRICH, Z. PHYS. C65 (95) 215, C71 (96) 55

WHICH ARE INTERPRETED AS AN EVIDENCE FOR TRANSITION TO QGP

M.G., Z. PHYS. C65 (95) 659
M.G., M. I. GORENSTEIN, ACTA PHYS. POLON. B30 (99) 2705

SUMMARY

- ANOMALIES IN PION AND $s\bar{s}$ YIELDS OBSERVED AT $\approx$ 40 A·GEV

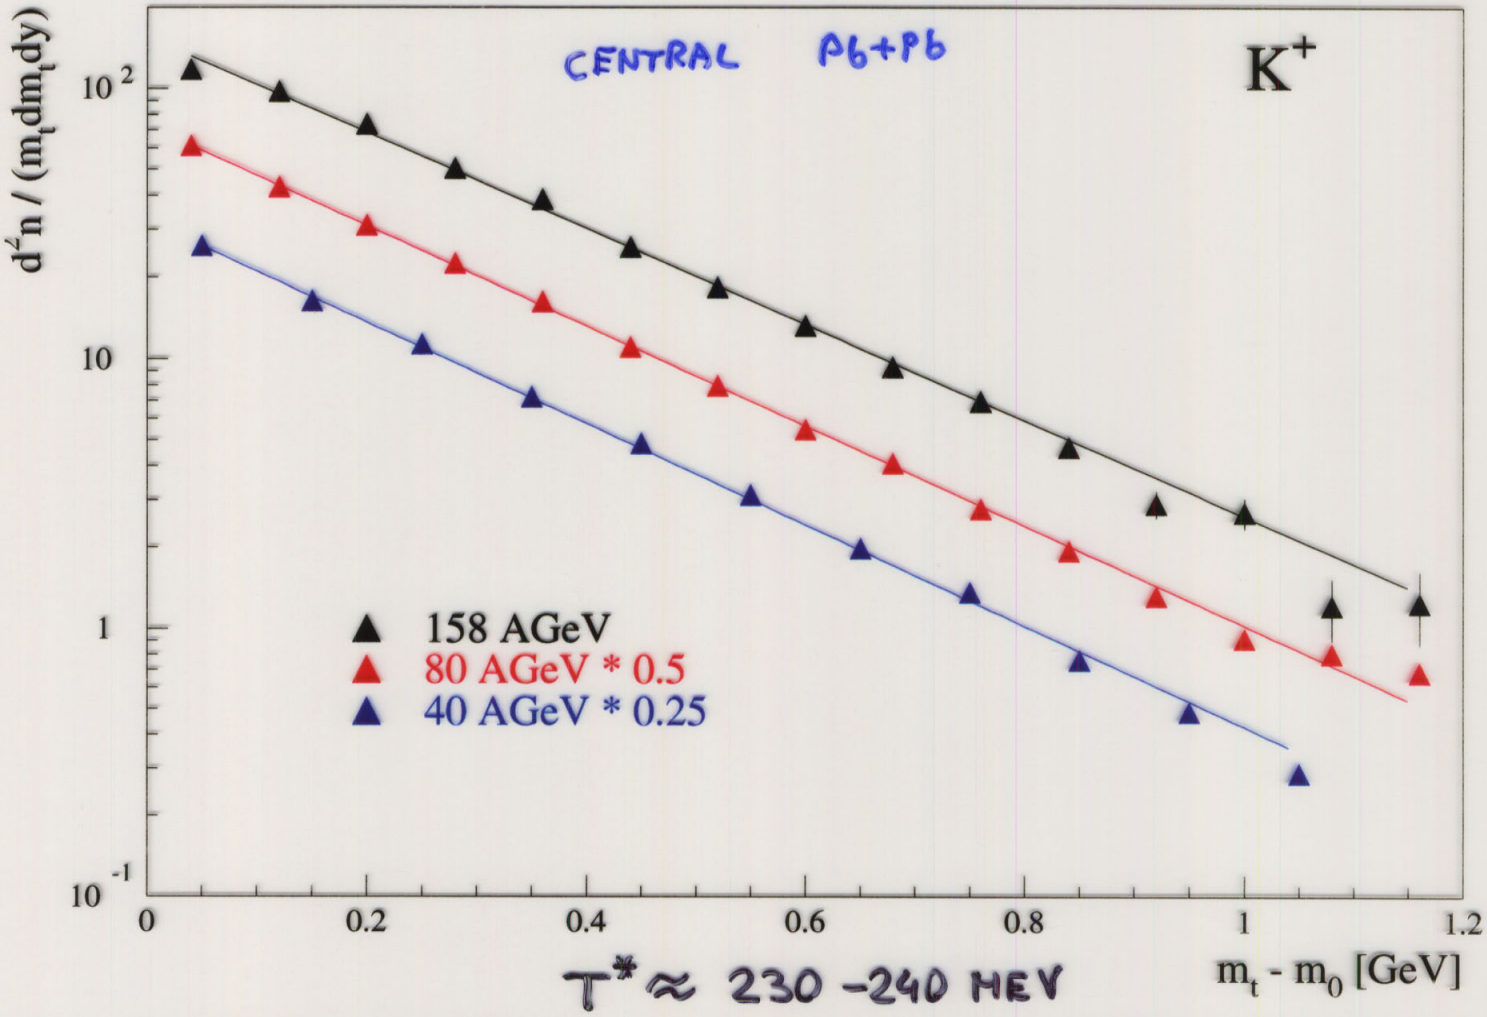
  PIONS: SUPPRESSION → ENHANCEMENT

  $s\bar{s}$: MAXIMUM OF $\langle K^+ \rangle / \langle \pi^+ \rangle$

- THEY ARE CONSISTENT WITH HYPOTHESIS OF TRANSITION TO DECONFIMENT MATTER (AGS → SPS) (WITHIN STATISTICAL MODEL OF THE EARLY STAGE)

IN PROGRESS:

- ANALYSIS OF OTHER OBSERVABLES (E-by-E, FLOW ...)
- STUDY OTHER ENERGIES (20, 30 AGEV IN 2002)
- STUDY ALTERNATIVE MODELS



$T^* \approx$ 230 -240 MEV
